Pair Programming

*Spring 2015*

1 What is Pair Programming?

Simply put, pair programming is “two people working together at a single computer” [1]. The practice has been popularized by a software development methodology called Extreme Programming (XP), and a number of researchers have studied the effects of incorporating pair programming into introductory and higher-level computer courses.

2 Why Pair Program?

Again, simply put:

- You will produce better code [3, 4]
- You will learn more by sharing your ideas with your peers and benefiting from their insights [2]
- You will become better at articulating your thoughts [3]
- You will enjoy your work more and spend less time frustrated [3, 4]
- You will be better prepared for more complicated software engineering tasks, both in school and beyond, where collaboration is imperative to success [2]

3 How to Pair Program

We first introduce the practice of pair programming, and then follow up with an informal description of the spirit behind it with the hope that a thorough understanding of its goals will help you and a partner work together productively and harmoniously. A successful pair programmer not only knows and adheres to the formal guidelines, but is also able to resolve intra-partner stress through constructive communication.
The Formal

When two programmers work with one keyboard, a division of labor is necessary. Originally, XP had one programmer type on the left half of the keyboard and the other on the right. However, that practice was abandoned due to the uncomfortable seating arrangements required and a statistically significant increase in repetitive stress injury (RSI). A perhaps more natural division of roles developed in its place:

**The Driver:** Responsible for typing, moving the mouse, etc.

**The Navigator:** Responsible for reviewing the driver’s work. In addition to catching incidental mistakes (that are nonetheless tedious to track down when solo-programming), the navigator considers the code at a more strategic level: how will this fit with the rest of the code? Will this implementation require changes elsewhere? Could we design this program better?

Every fifteen minutes or so, the pair switches roles by sliding the keyboard over [4]. That’s a pretty loaded sentence, so let’s break it down:

“*Every fifteen minutes or so...*” You can wait for a natural breaking point [3], but no one should drive more than 20 minutes or less than 10.

“*...the pair switches roles...*” To avoid animosity, ensure the integrity of the team, and keep pair programming fun—it’s important that both partners spend an equal amount of time in each role. Some programmers may enjoy driving better, others navigating; however, neither partner does the other a favor by letting him spend more time in a fixed role.

“*...by sliding the keyboard.*” This is not done by rearranging chairs and adjusting the monitor. That is to say, regardless of roles, you are both working together on the problem at hand. As such you are seated next to each other with the monitor adjusted so you can both see the screen easily. All that’s required when you switch, then, is to push the keyboard a few inches this way or that. [4]

It is important to distinguish pair programming from another distinct cooperative division of labor: divide-and-conquer. In the latter strategy, two
people responsible for completing a single task break down the task into
smaller pieces, partition the resulting subtasks among themselves, and each
works on “his or her part” separately. This strategy can be used successfully,
but it should not be confused with pair programming.

The Informal

Here, we outline various practices and perspectives that provide a foundation
for your pair programming experience. Knowing that you and your partner
have both read this, the two of you will have a common expectation about
the pair programming experience and should be able to work together more
effectively. These practices and perspectives are inspired principally by All I
Really Need to Know About Pair Programming I Learned in Kindergarten, a
well-written essay that programmers at every level are encouraged to read.

Respect Each Other’s Time

Show up on time. Cut calls short. Don’t check email or play online games.
Respect involves communication. If you partner is often late, bring it up. If
you receive a call that you must answer, let your partner know and reschedule
your meeting, acknowledging that you’ve inconvenienced your partner.

Be a Team Player

Take collective ownership of the code you and your partner are writing,
abandoning the notion of “my part” and “your part.” And, in light of that
view, make sure you speak up when you think an error’s been introduced,
and don’t be too proud to admit a mistake. Finally, if you work on any
code alone (for example, if you a solution comes to you in a dream, or in
the shower), review it together line-by-line before incorporating it into your
program. Often, it’s useful for the two of you to rewrite solo code from
scratch (you’d be surprised how many errors you can catch that way).

Again, communication is crucial. Perhaps you’re having a hard time adjust-
ing to pair programming, or your partner continues to say “my” instead of
“our” work. Speak your mind and work through any problems.
Offer to cease driving when it’s time (“Hey, would you like a go at the keyboard?”), and remind your partner it’s time to switch when you’re navigator (“Mind if I drive for a while?”).

**Be Open-minded and Light-hearted**

One of the most important predictors of success in pair programming is buy-in: if you are determined to make the practice fail, it will. Choose a healthy perspective: laugh at your mistakes, apologize if you hurt your partner’s feelings, and, more generally, look at pair programming as an opportunity to learn.

Also, realize that pair programming can be a pretty demanding activity, so take breaks when you need them. Perhaps a five-minute microbreak is all you need: to check email, get a drink of water, or catch some fresh air. Or maybe you would like to take an hour off to get dinner.

**Seek Advice When You Need It**

It’s important to realize that you and your partner are not alone: if the two of you are having trouble working together, it’s important to let an HTA or the professor know so she or he can provide further guidance. The HTAs and professors are familiar with the pair programming philosophy and the difficulties that may arise. They will be able to assist in conflict resolution and/or help you and your partner re-pair if necessary.

It is not acceptable in pair programming for a single person to do all (or even most) of the work and then add his partner’s name. Academic honesty is always more important than fulfilling a pair programming requirement. If your partner is unwilling to help or fails to show up at scheduled meetings, or if your partner is unwilling or resistant to letting you contribute your share of the work, contact an HTA or the professor. Asking for help is not an inflammatory action, but an important step in conflict resolution.

**4 Pair Programming in CS4**

Given enough eyeballs, all bugs are shallow.

—Eric Raymond
To summarize the collaboration policy included in the course missive:

- For most labs during the course, you will be required to pair program, following the methodology outlined in this document. You’re expected to work with a different partner at every lab, so don’t worry about finding a partner in advance.

- For each project, unless otherwise indicated, you have the option to pair program following the methodology of this document. If you opt to work on a project in this way, you and your partner need to let the TAs know prior to the project’s partner selection deadline (usually one week before the project due date). You are expected to follow the methodology outlined above even when you are not actively coding. You can do this by sharing a notebook or a whiteboard, instead of a screen, as you plan and design your program(s), and develop solutions that require a written answer. You and your partner are each expected to understand (and be able to replicate) everything you turn in.

- On homeworks, you may not pair program. All of the rules outlined in the Collaboration Policy regarding homeworks still apply.

- On exams, no collaboration of any sort is permitted.

You are encouraged to read All I Really Need to Know About Pair Programming I Learned in Kindergarten, to enhance your understanding of the methodology. [4]
