

Functional Programming Final Review

CS16: Introduction to Data Structures & Algorithms
Spring 2020

Functional Programming Paradigm

- ▶ A style of building the structure and elements of computer programs that treats computation as the evaluation of *mathematical functions*.
- ▶ Programs written in this paradigm rely on smaller methods that do one part of a larger task. The results of these methods are combined using function compositions to accomplish the overall task.

Approaches

- ▶ How do we decide to use map vs. reduce?
 - ▶ Map creates a one to one mapping - we use it for (sub)-problems that involve doing the same thing to multiple elements.
 - ▶ Length will stay the same!
 - ▶ Reduce can be used to “summarize” a list, or create a new (smaller or larger) list
 - ▶ Map can be implemented with reduce, but not vice-versa!

Using Map

- ▶ How to choose the function?
 - ▶ What do you want to have happen to *each* element in the input list?
 - ▶ Other variables needed for the function can be created outside of the map call if needed!
- ▶ Quick Tip
 - ▶ Built-ins/existing functions do not need to have their arguments written out.

```
map(lambda x: f(x), input_list) => map(f, input_list)
```

Using Reduce 1/2

- ▶ How to choose the binary function?
 - ▶ Takes in the acc and each successive element in the input list.
 - ▶ Think about how to break down your task!
 - ▶ the max of an entire list -> the max of two integers
 - ▶ remove all successive duplicates -> check if 2 elements are equal
- ▶ Remember ternary syntax!

```
a if condition else b
```

Using Reduce 2/2

- ▶ How to choose the accumulator?
 - ▶ Needs to be of the type that you are returning
 - ▶ What should your operation return on the empty list?

List Syntax

- ▶ `[x]`
 - ▶ makes a list out of element `x`
- ▶ `my_list[-1]`
 - ▶ returns the last element in `my_list`
- ▶ `my_list + [x]`
 - ▶ returns a new list with `x` at the end, and does not modify the original list.
 - ▶ don't use `append`! this modifies the original list and returns nothing.

Practice Problems

- ▶ Write a function that will turn a list of nouns into adverbs. (ex: loud -> loudly)
- ▶ Write a function that sums the total length of a list of strings. (ex: ["hi", "cs16"] -> 6)
- ▶ Write a function that counts the number of times the string "dog" appears in a list of strings.
- ▶ Write a function that removes numbers less than 10 from a list of ints.

Practice Problem Answers

- ▶ `map(lambda el: el+"ly", input_list)`
- ▶ `reduce(lambda acc, el: acc+el, map(len, input_list), 0)`
- ▶ `reduce(lambda acc, el: acc+1 if el == "dog" else acc, input_list, 0)`
- ▶ `reduce(lambda acc, el: acc+[el] if el > 10 else acc, input_list, [])`

Dynamic Programming

Final Review

CS16: Introduction to Data Structures & Algorithms
Spring 2020

What is Dynamic Programming?

- ▶ Algorithm design paradigm/framework
 - ▶ Design efficient algorithms for optimization problems
- ▶ Optimization problems
 - ▶ “find the **best** solution to problem \mathbf{x} ”
 - ▶ “what is the **shortest** path between \mathbf{u} and \mathbf{v} in \mathbf{G} ”
 - ▶ “what is the **minimum** spanning tree in \mathbf{G} ”
- ▶ Can also be used for non-optimization problems

When is Dynamic Programming Applicable?

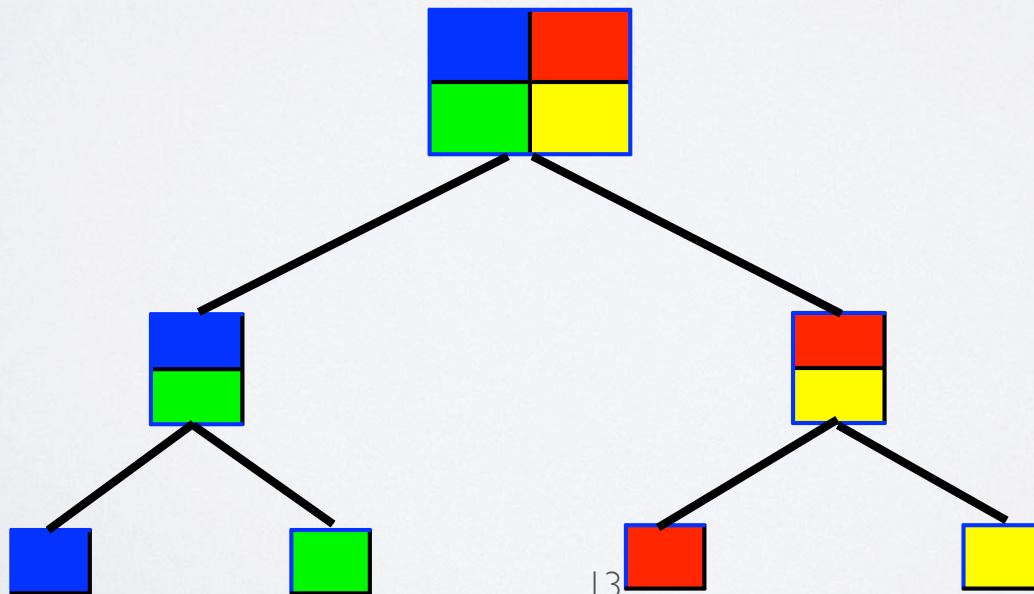

- ▶ Condition **#1**: sub-problems
 - ▶ The problem can be solved recursively
 - ▶ Can be solved by solving sub-problems
- ▶ Condition **#2**: overlapping sub-problems
 - ▶ Same sub-problems need to be solved many times

Sub-Problems

$$\text{sol} \left(\begin{array}{|c|c|} \hline \text{blue} & \text{red} \\ \hline \text{green} & \text{yellow} \\ \hline \end{array} \right) = \text{sol} \left(\begin{array}{|c|} \hline \text{blue} \\ \hline \text{green} \\ \hline \end{array} \right) \oplus \text{sol} \left(\begin{array}{|c|} \hline \text{red} \\ \hline \text{yellow} \\ \hline \end{array} \right)$$

$$\text{sol} \left(\begin{array}{|c|} \hline \text{blue} \\ \hline \text{green} \\ \hline \end{array} \right) = \text{sol} \left(\begin{array}{|c|} \hline \text{blue} \\ \hline \end{array} \right) \oplus \text{sol} \left(\begin{array}{|c|} \hline \text{green} \\ \hline \end{array} \right)$$

$$\text{sol} \left(\begin{array}{|c|} \hline \text{red} \\ \hline \text{yellow} \\ \hline \end{array} \right) = \text{sol} \left(\begin{array}{|c|} \hline \text{red} \\ \hline \end{array} \right) \oplus \text{sol} \left(\begin{array}{|c|} \hline \text{yellow} \\ \hline \end{array} \right)$$

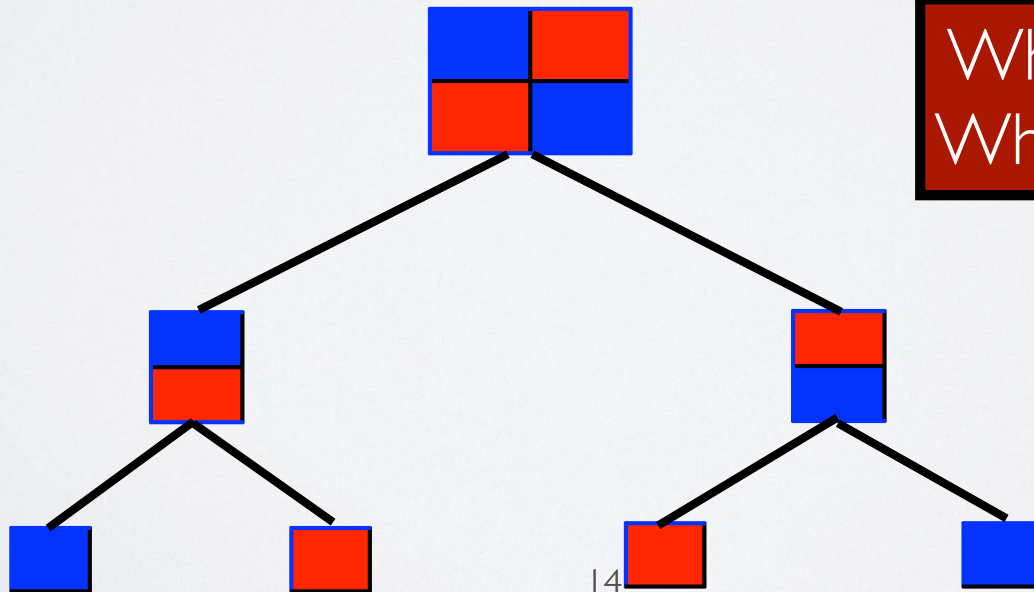

Overlapping Sub-Problems

$$\text{sol} \left(\begin{array}{|c|c|} \hline \text{blue} & \text{red} \\ \hline \text{red} & \text{blue} \\ \hline \end{array} \right) = \text{sol} \left(\begin{array}{|c|} \hline \text{blue} \\ \hline \text{red} \\ \hline \end{array} \right) \oplus \text{sol} \left(\begin{array}{|c|} \hline \text{red} \\ \hline \text{blue} \\ \hline \end{array} \right)$$

$$\text{sol} \left(\begin{array}{|c|} \hline \text{blue} \\ \hline \text{red} \\ \hline \end{array} \right) = \text{sol} \left(\begin{array}{|c|} \hline \text{blue} \\ \hline \end{array} \right) \oplus \text{sol} \left(\begin{array}{|c|} \hline \text{red} \\ \hline \end{array} \right)$$

$$\text{sol} \left(\begin{array}{|c|} \hline \text{red} \\ \hline \text{blue} \\ \hline \end{array} \right) = \text{sol} \left(\begin{array}{|c|} \hline \text{red} \\ \hline \end{array} \right) \oplus \text{sol} \left(\begin{array}{|c|} \hline \text{blue} \\ \hline \end{array} \right)$$

Why solve red twice?
Why solve blue twice?

When is Dynamic Programming Applicable?

- ▶ Core idea
 - ▶ Decompose problem into its sub-problems
 - ▶ and if sub-problems are overlapping then
 - ▶ solve each sub-problem once and store the solution
 - ▶ use stored solution when you need to solve sub-problem again

Steps to Solving a Problem w/ DP

- ▶ What are the **sub-problems**?
- ▶ What is the “**magic**” step?
 - ▶ Given solution to a sub-problem...
 - ▶ ...how do I *combine* them to get solution to the problem?
- ▶ Which **(topological) order** on sub-problems can I use?
 - ▶ so that solutions to sub-problems available before I need them
- ▶ Design iterative **algorithm**
 - ▶ that solves sub-problems in order and stores their solution

Shortest Path in Layered Directed Graph

- ▶ Layered
 - ▶ edge (x, y) only if $x < y$
- ▶ Negative & positive weights
