

## Second Activity

*Sept. 15, 2011*

1. We are now going to read in several XML votes instead of just one. We've downloaded them for you. Make a `VoteData` folder. Download the five votes files from the Class 2 webpages into that `VotesData` folder.
2. In Excel, create a new spreadsheet, and import the first of the XML files in the `VoteData` folder.
3. Again in Excel, click on the top left-hand "Office" button. Go to "Excel options," and click the checkbox for "Show Developer tab in the ribbon."
4. Click the **Developer** tab, and look for the XML group. In there, click on **Map Properties**; at the bottom, select **Append new data...**, so that as we read in other XML files, they get added to the stuff we've already got. Click **OK**.
5. Click **XML...Import** in the XML area of the ribbon. Navigate to your `VoteData` folder, and click-and-drag to select all except the first XML files there. This doesn't always work; you may have to import them individually. Once you have XML files selected for import, click **Import**. When you are done, instead of 101 rows, you should have about 501 rows of data, neatly organized.
