### Computational Security

- **Concrete Approach:**

A scheme is  $(t, \varepsilon)$ -secure if  $\forall A$  running in time  $\leq t$  succeeds in breaking the scheme with probability  $\leq \varepsilon$ .

- **Asymptotic Approach:**

Introduce a security parameter  $n$

A scheme is secure if  $\forall A$  running in time  $\text{poly}(n)$  succeeds in breaking the scheme with probability  $\leq \text{negl}(n)$

# Computationally Secure Encryption

- **Syntax:**

A symmetric-key encryption scheme is defined by PPT algorithms  
 $(\text{Gen}, \text{Enc}, \text{Dec})$ :

$$k \leftarrow \text{Gen}(1^n)$$

$$c \leftarrow \text{Enc}_k(m) \quad m \in \{0,1\}^*$$

$$m/\perp := \text{Dec}_k(c)$$

- **Correctness:**  $\forall n, \exists k \text{ output by } \text{Gen}(1^n), \forall m \in \{0,1\}^*$

$$\text{Dec}_k(\text{Enc}_k(m)) = m$$

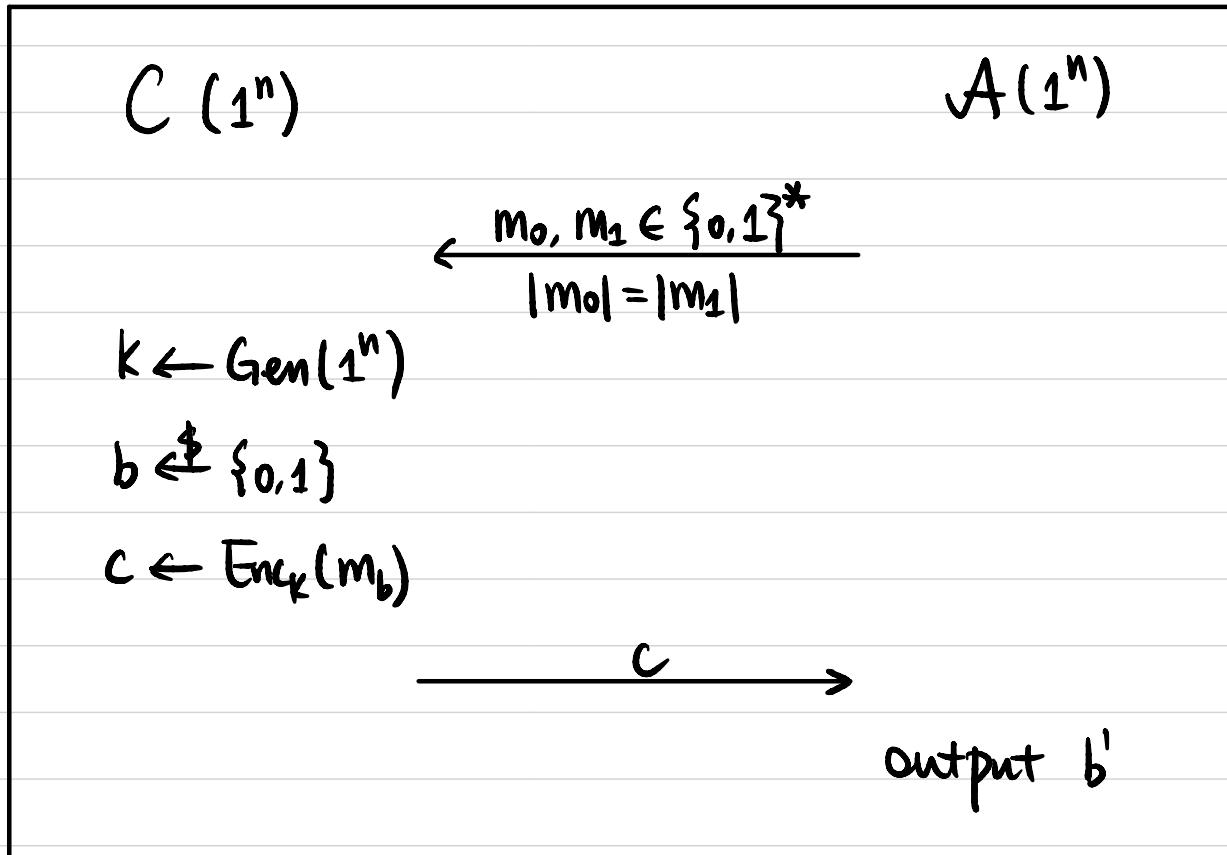

# Computationally Secure Encryption

Def 1 A symmetric-key encryption scheme (Gen, Enc, Dec)

is semantically secure if  $\forall \text{PPT } A, \exists \text{negligible function } \varepsilon(\cdot) \text{ s.t.}$

computationally  
indistinguishable

$$\Pr[b = b'] \leq \frac{1}{2} + \varepsilon(n)$$

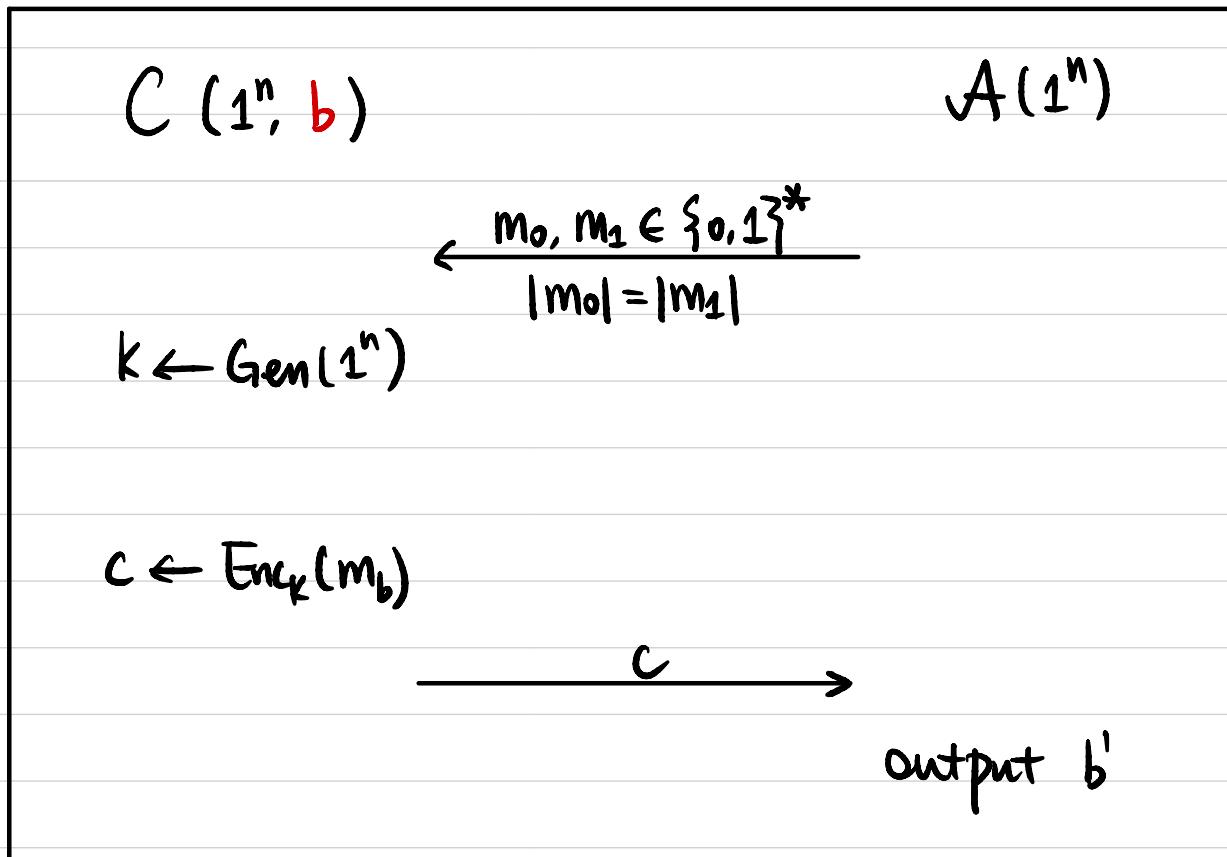

# Computationally Secure Encryption

Def 2 A symmetric-key encryption scheme (Gen, Enc, Dec)

is semantically secure if  $\forall \text{PPT } A, \exists \text{negligible function } \varepsilon(\cdot) \text{ s.t.}$

computationally  
indistinguishable

$$\left| \Pr[b' = 1 \mid b=0] - \Pr[b' = 1 \mid b=1] \right| \leq \varepsilon(n)$$

# Computationally Secure Encryption

Def 1 A symmetric-key encryption scheme (Gen, Enc, Dec)

is semantically secure if  $\forall \text{PPT } A :$

$$\Pr[b = b'] \leq \frac{1}{2} + \text{negl}(n) \quad \text{in Game 1.}$$

Def 2  $|\Pr[b' = 1 | b=0] - \Pr[b' = 1 | b=1]| \leq \text{negl}(n) \quad \text{in Game 2.}$

Def 1  $\Rightarrow$  Def 2: If  $\Pi = (\text{Gen}, \text{Enc}, \text{Dec})$  is secure under Def 1,  
then  $\Pi$  is also secure under Def 2.

Proof: Assume  $\Pi$  is not secure under Def 2, then

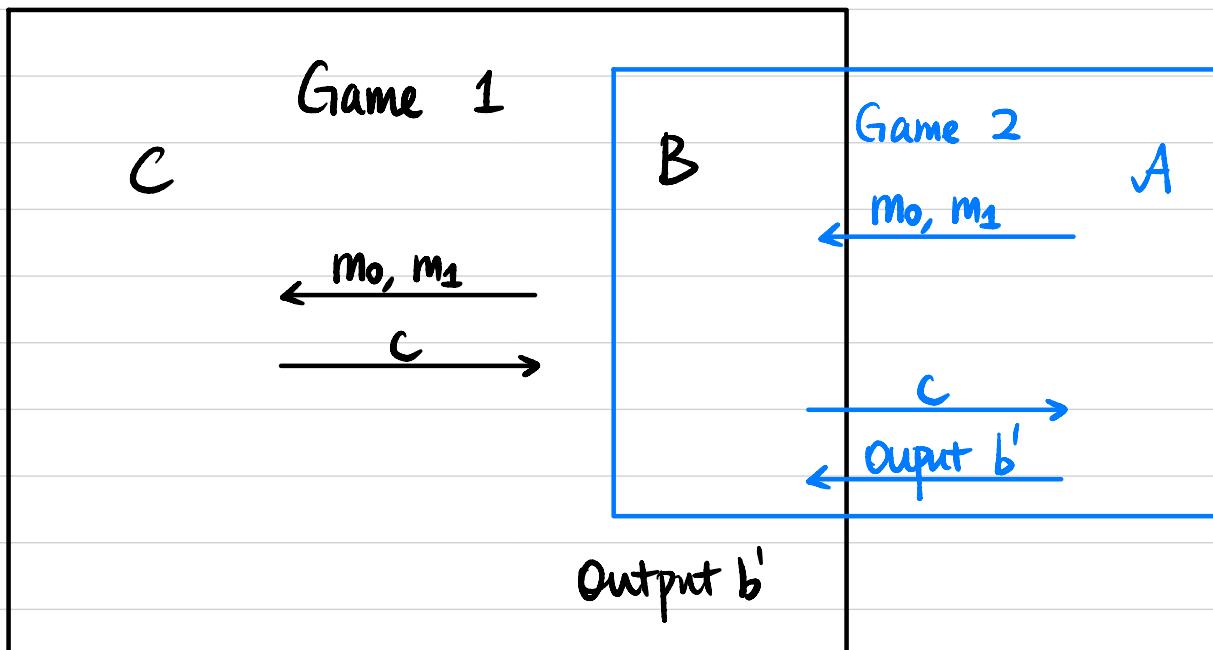

$\exists$  PPT A, non-negligible function  $\gamma(\cdot)$  s.t.

$$\left| \Pr[b' = 1 \mid b=0] - \Pr[b' = 1 \mid b=1] \right| \geq \gamma(n) \text{ in Game 2.}$$

$\stackrel{\text{"}}{\alpha} \qquad \stackrel{\text{"}}{\beta} \qquad |\alpha - \beta| \geq \gamma(n).$

Assume  $\beta - \alpha \geq \gamma(n)$ :

We construct a PPT B to break Def 1

Proof (Continued):

$$\Pr[b = b' \text{ in Game 1}]$$

$$= \Pr[b = 0] \cdot \Pr[b' = 0 \mid b = 0] + \Pr[b = 1] \cdot \Pr[b' = 1 \mid b = 1]$$

$$= \frac{1}{2} \cdot (1 - \alpha) + \frac{1}{2} \cdot \beta$$

$$= \frac{1}{2} + \frac{\beta - \alpha}{2}$$

$$\geq \frac{1}{2} + \frac{\gamma(n)}{2}$$

↑  
non-negligible

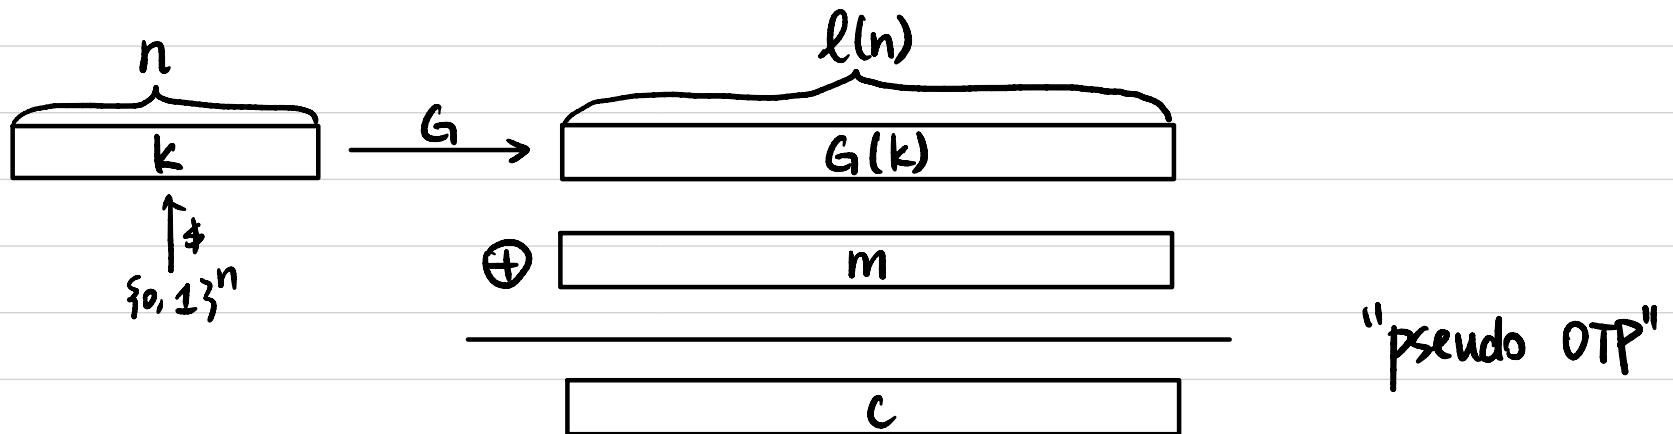

If  $\alpha - \beta \geq \gamma(n)$ : Construct  $B$  to output  $1 - b'$

# Constructing Secure Encryption

Pseudorandom Generator (PRG)

Semantically Secure Encryption

## (Pseudo)randomness

What does it mean to be random?

Is this string random?

011011010110001

010101010101010

What does it mean to be pseudorandom?

# Pseudorandomness

- Concrete Definition:

$D$ : a distribution over  $n$ -bit strings.

$D$  is  $(t, \varepsilon)$ -pseudorandom if  $\forall A$  running in time  $\leq t$ ,

$$\left| \Pr_{x \leftarrow D} [A(x) = 1] - \Pr_{x \leftarrow U_n} [A(x) = 1] \right| \leq \varepsilon.$$

$\uparrow$   
Uniform distribution over  $\{0, 1\}^n$

- Asymptotic Definition:

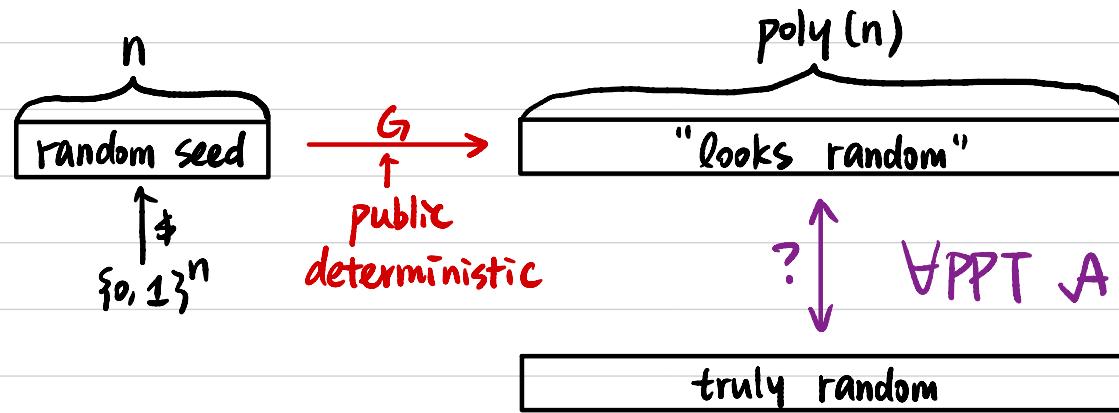

$D = \{D_1, D_2, \dots\}$  an ensemble of distributions,

$D_n$ : a distribution over  $n$ -bit string.

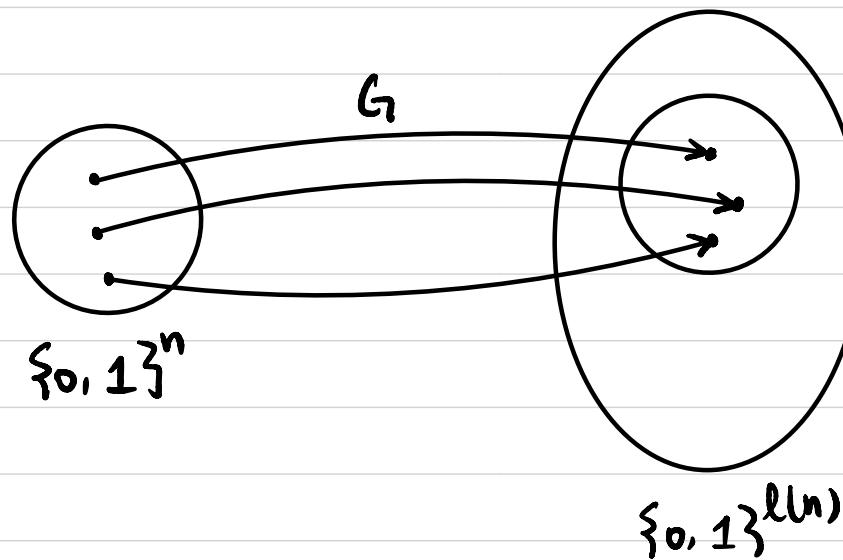

$D$  is pseudorandom if  $\forall \text{PPT } A, \exists \text{negligible function } \varepsilon(\cdot) \text{ s.t.}$

$$\left| \Pr_{x \leftarrow D_n} [A(x) = 1] - \Pr_{x \leftarrow U_n} [A(x) = 1] \right| \leq \varepsilon(n).$$

# Pseudorandom Generator (PRG)

$$G: \{0,1\}^n \rightarrow \{0,1\}^{l(n)} \quad l(n) > n$$

## Pseudorandom Generator (PRG)

$$G: \{0,1\}^n \rightarrow \{0,1\}^{l(n)} \quad l(n) > n$$

Def 1  $G$  is a pseudorandom generator (PRG) if

$\forall$  PPT  $A$ ,  $\exists$  negligible function  $\text{negl}(\cdot)$  s.t.

$$\left| \Pr_{s \leftarrow U_n} [A(G(s)) = 1] - \Pr_{x \leftarrow U_{l(n)}} [A(x) = 1] \right| \leq \text{negl}(n)$$

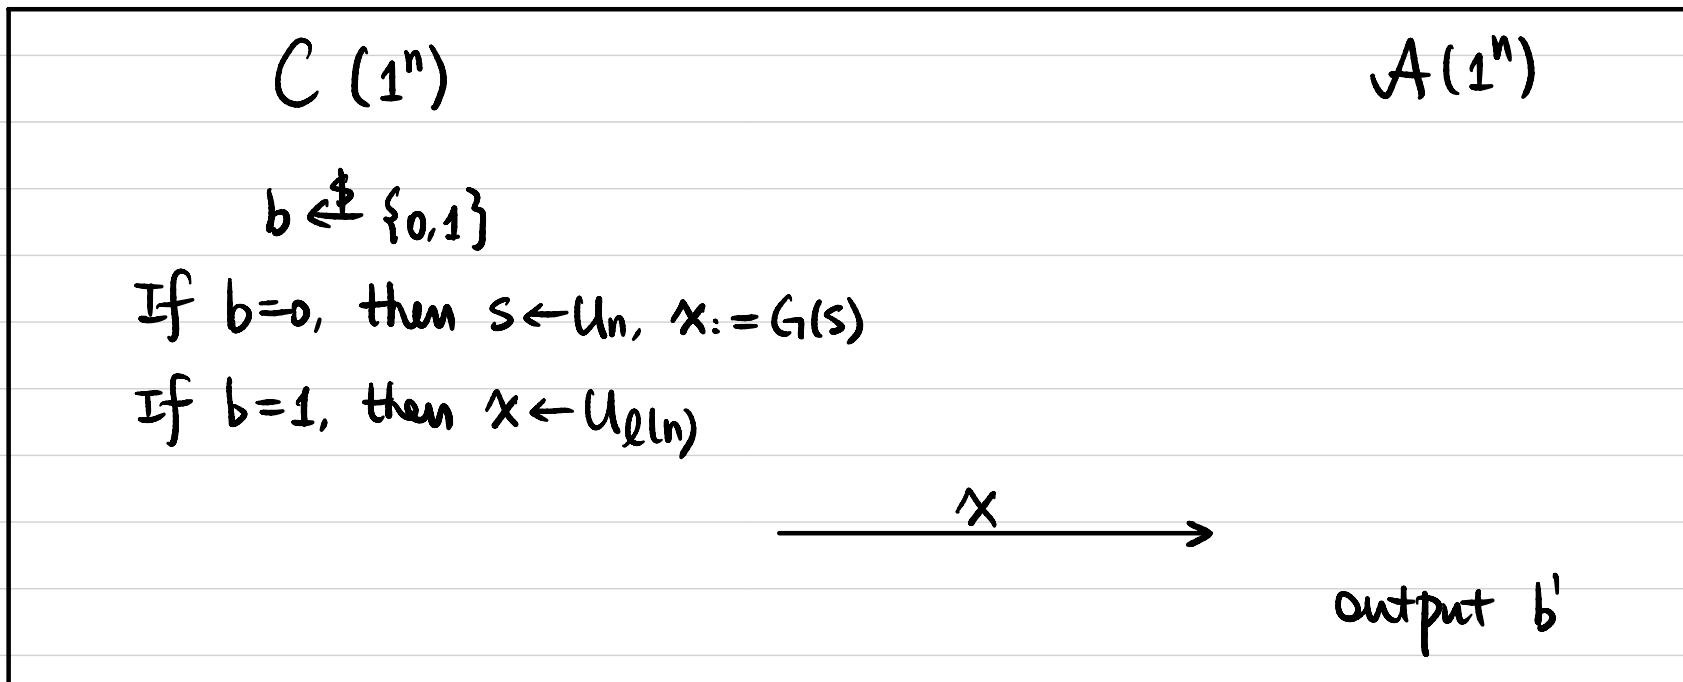

## Pseudorandom Generator (PRG)

$$G: \{0,1\}^n \rightarrow \{0,1\}^{l(n)} \quad l(n) > n$$

Def 2  $G$  is a pseudorandom generator (PRG) if

$\forall$  PPT  $A$ ,  $\exists$  negligible function  $\text{negl}(\cdot)$  s.t.

$$\Pr[b = b'] \leq \frac{1}{2} + \text{negl}(n)$$

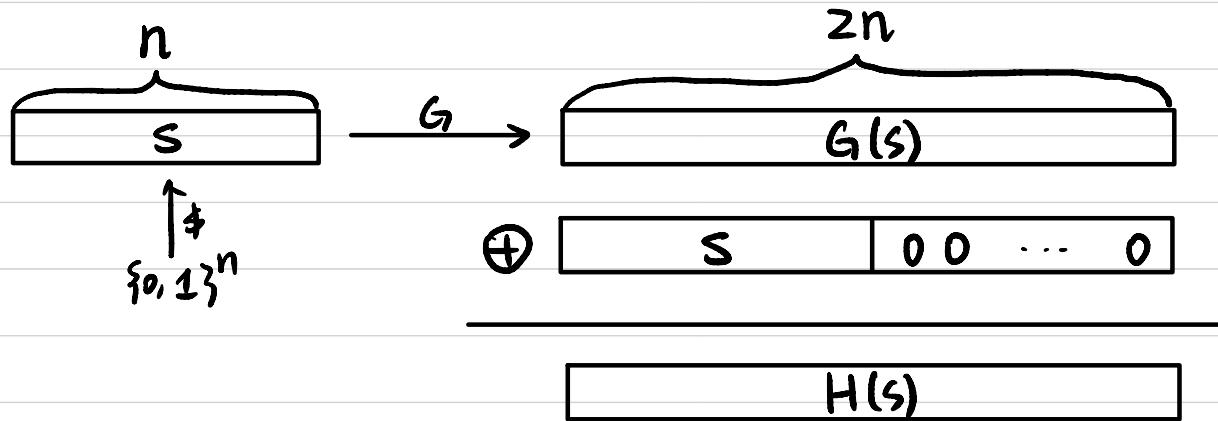

What if  $A$  is computationally unbounded?

## Exercise

Let  $G: \{0,1\}^n \rightarrow \{0,1\}^{2n}$  be a PRG.

Construct  $H: \{0,1\}^n \rightarrow \{0,1\}^{2n}$  as  $H(s) := G(s) \oplus (s || 0^n)$ .

Is  $H$  necessarily a PRG?

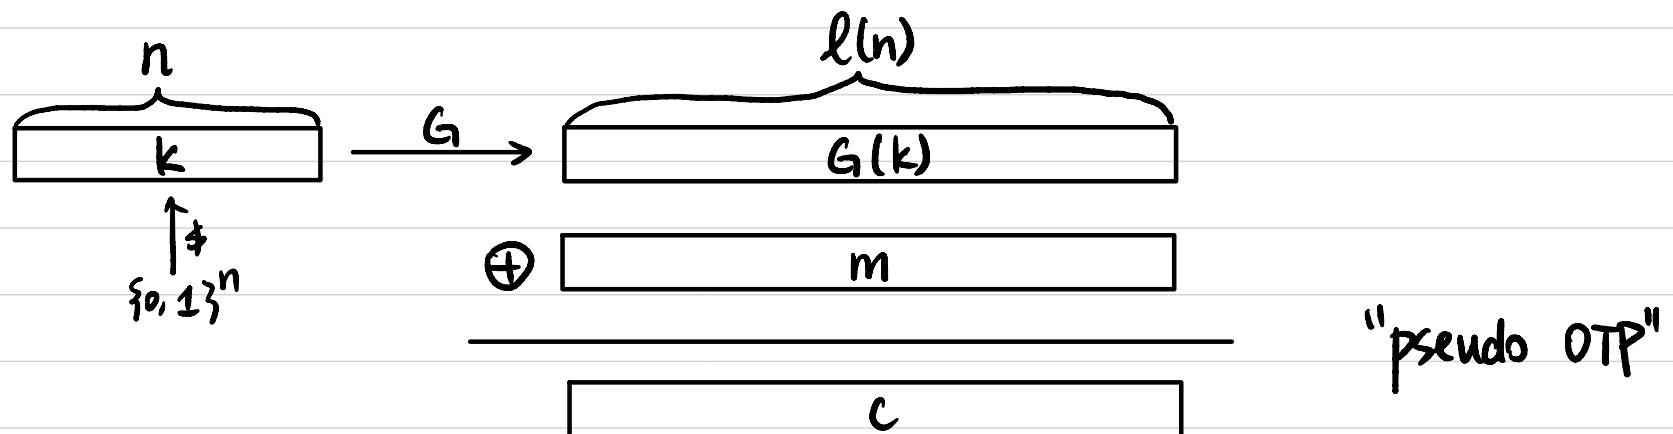

If yes  $\Rightarrow$  prove:  $\forall$  PRG  $G$ ,  $H$  is also a PRG

If no  $\Rightarrow$  show counterexample  $\exists$  PRG  $G$ ,  $H$  is not a PRG.

## Fixed-Length Encryption Scheme

Let  $G: \{0,1\}^n \rightarrow \{0,1\}^{l(n)}$  be a PRG.

- $\text{Gen}(1^n)$ : Sample  $k \leftarrow \{0,1\}^n$ , output  $k$ .
- $\text{Enc}_k(m)$ :  $m \in \{0,1\}^{l(n)}$ .  
output  $c := G(k) \oplus m$ .
- $\text{Dec}_k(c)$ :  $c \in \{0,1\}^{l(n)}$ .  
output  $m := G(k) \oplus c$ .

## Proof of Security

Theorem If  $G$  is a PRG, then  $\Pi = (\text{Gen}, \text{Enc}, \text{Dec})$  is semantically secure for fixed-length messages.

Assume  $\Pi$  is not semantically secure, then

$\exists$  PPT A that breaks  $\Pi$

↳ construct PPT B to break  $G$ .
