

CSCI 1515 Applied Cryptography

This Lecture:

- SNARGs from PCP (continued)
- SNARGs from Linear PCP
- Introduction to MPC

Succinct Non-Interactive Argument (SNARG)

Def A non-interactive $\forall P^*$ proof/argument system is succinct if $\forall PPT P^*$ (in soundness)

- The proof π is of length $|\pi| = \text{poly}(\lambda, \log |C|)$
- The verifier runs in time $\text{poly}(\lambda, |x|, \log |C|)$

- **SNARK**: Succinct Non-Interactive Argument of Knowledge
- **zk-SNARG/zk-SNARK**: SNARG/SNARK + Zero-Knowledge

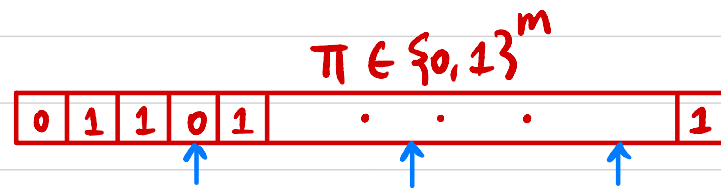

Probabilistically Checkable Proof (PCP)

Prover

(x, w)

Verifier

(x)

PCP Theorem (Informal):

Every NP language has a PCP where the Verifier reads only a constant number of bits of the proof.

First Attempt

Prover

(x, w)

$\text{Com} \left(\begin{array}{|c|c|c|c|c|c|c|c|} \hline 0 & 1 & 1 & 0 & 1 & & \cdot & \cdot & \cdot & & 1 \\ \hline \end{array} \right)$

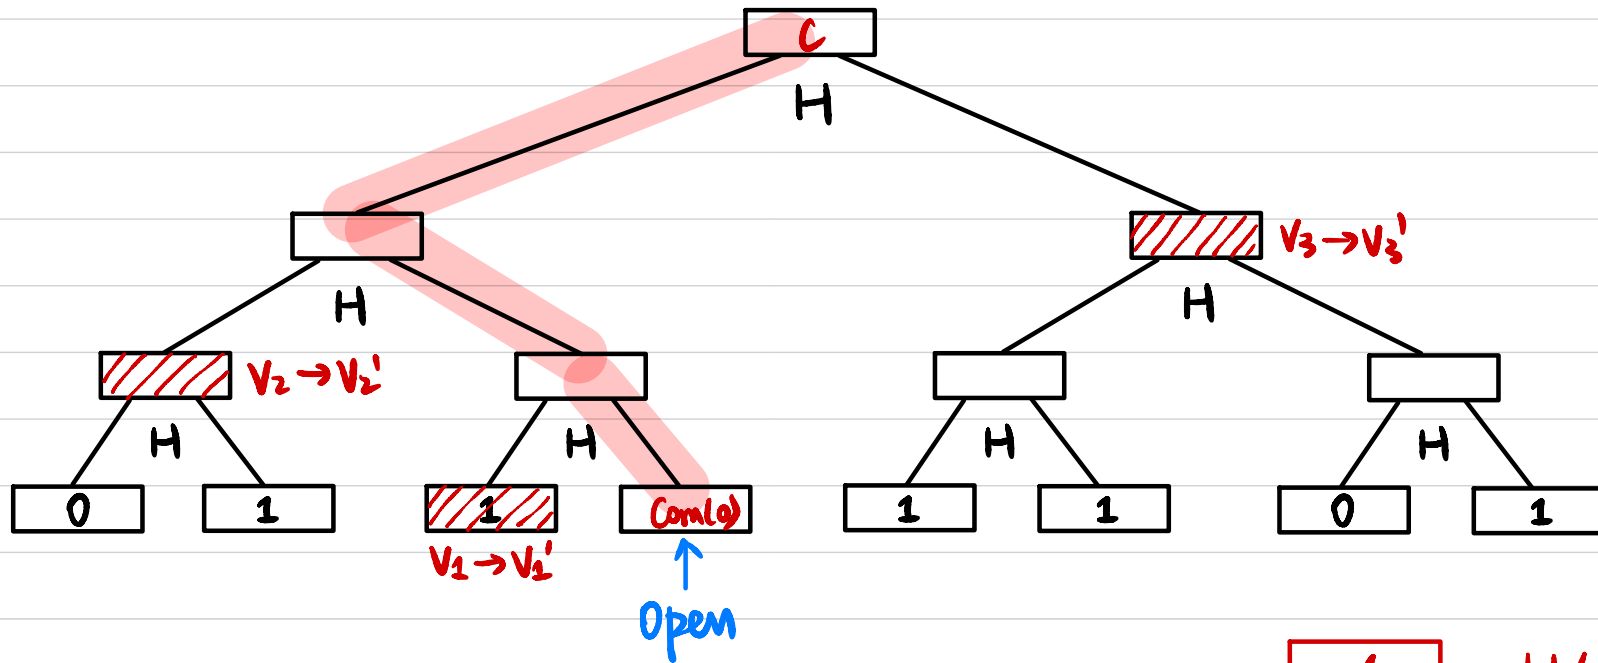

Verifier

(x)

$\leftarrow i, j, k$

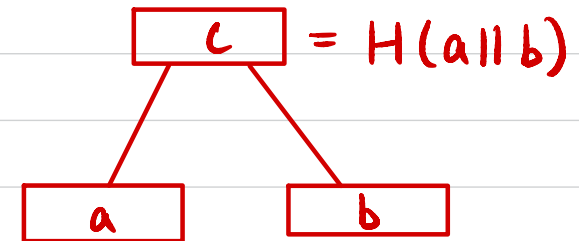

$\text{Open } \text{Com}(\pi_i), \text{Com}(\pi_j), \text{Com}(\pi_k)$

Merkle Tree

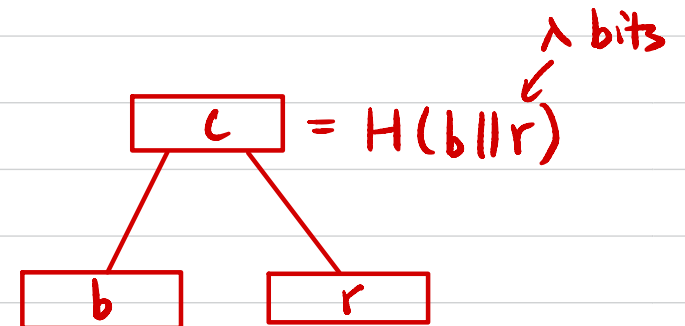

Why (computationally) binding?

Collision Resistance of Hash

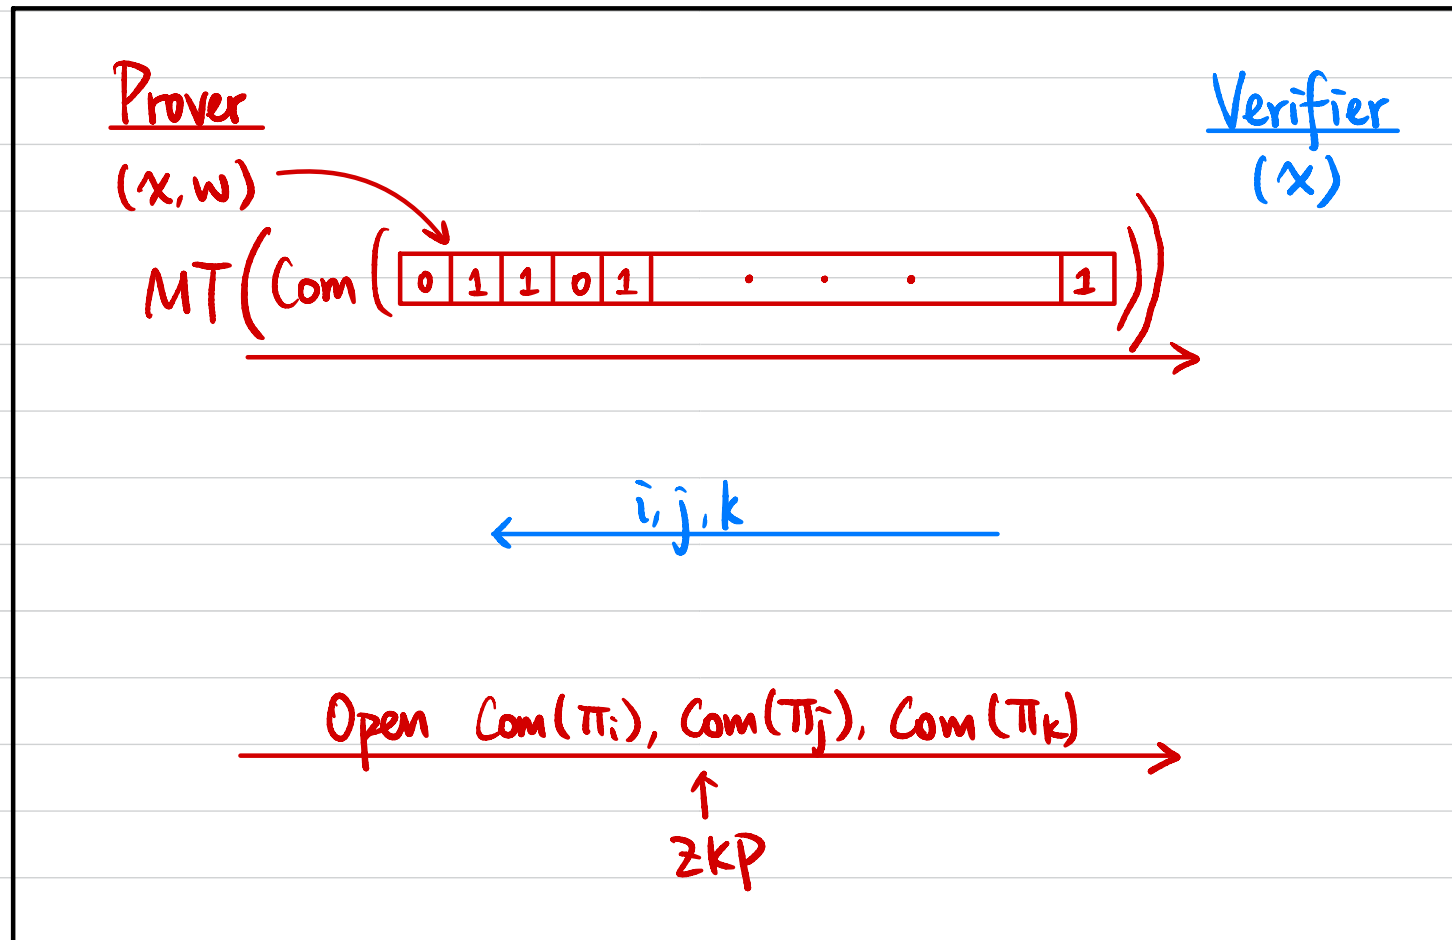

Can we make it hiding?

Commitment to b

Is it ZK?

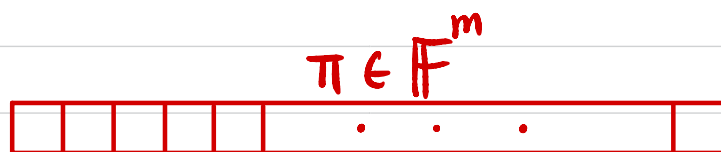

Linear PCP

Prover

(x, w)

Verifier

(x)

independent of x $\left\{ \begin{array}{l} q_1 \in \mathbb{F}^m \Rightarrow \langle \pi, q_1 \rangle \in \mathbb{F} \\ \vdots \\ q_t \in \mathbb{F}^m \Rightarrow \langle \pi, q_t \rangle \in \mathbb{F} \end{array} \right.$

Constructing LPCP for Circuit Satisfiability:

- From Walsh-Hadamard code, $m = O(|C|^2)$
- From quadratic span programs, $m = O(|C|)$

Preprocessing Model (Designated Verifier)

Prover

Verifier

$$(pk, sk) \leftarrow \text{Gen}(1^\lambda)$$

$$q_1 \in \mathbb{F}^m \quad c_1 \leftarrow \text{Enc}_{pk}(q_1)$$

$$\vdots$$

$$q_t \in \mathbb{F}^m \quad c_t \leftarrow \text{Enc}_{pk}(q_t)$$

$$\leftarrow \frac{pk, c_1, \dots, c_t}{(\text{publish})}$$

T_{LPCP}

$$(x, w) \rightarrow \pi \in \mathbb{F}^m$$

(x)

sk, T_{LPCP}

$$\text{Enc}_{pk}(\langle \pi, q_1 \rangle) \rightarrow r_1$$

$$\vdots$$

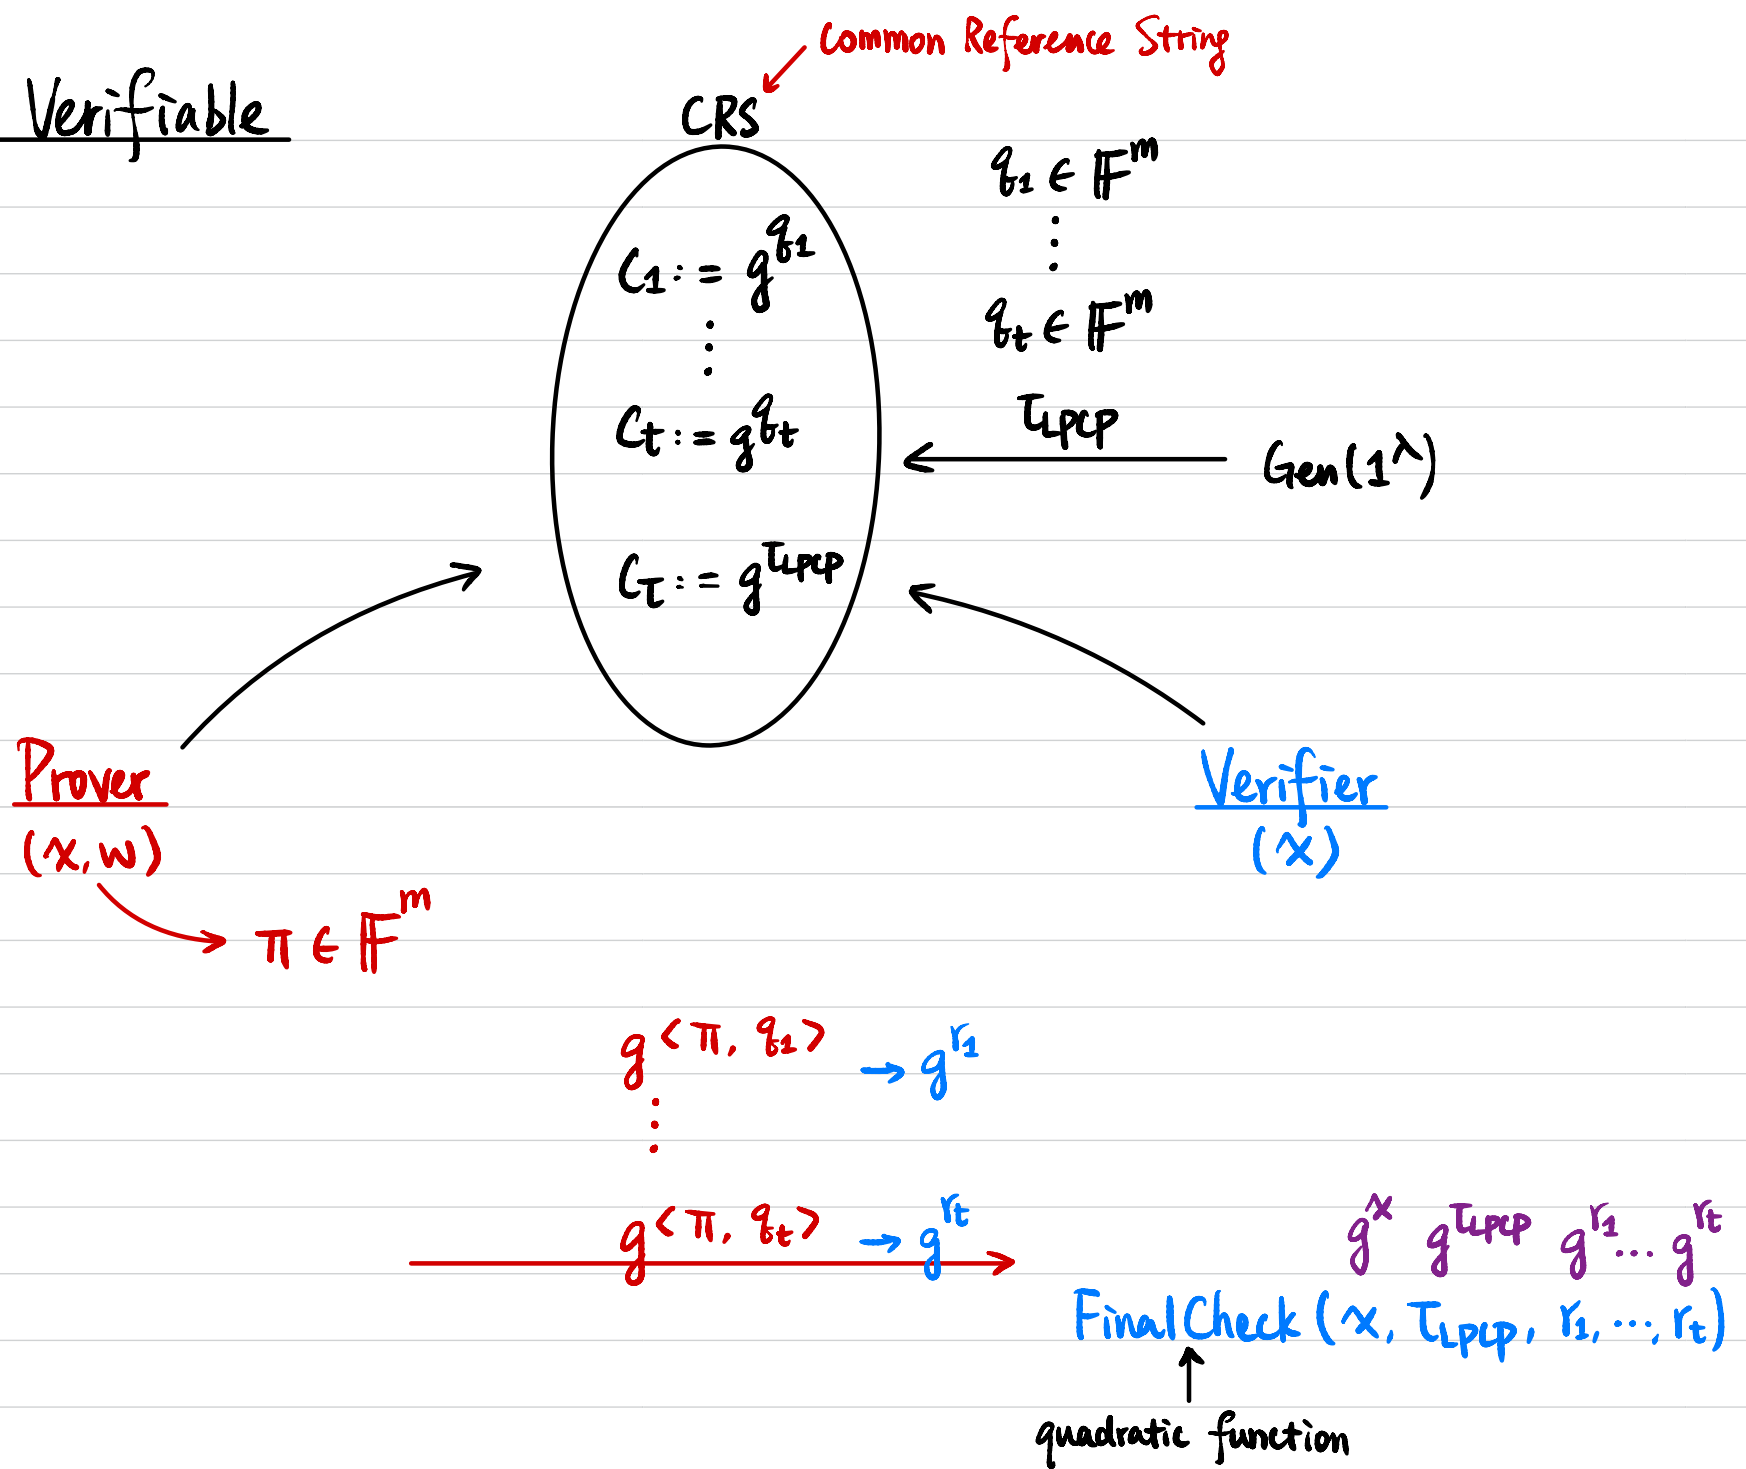

$$\text{Enc}_{pk}(\langle \pi, q_t \rangle) \rightarrow r_t$$

Additively Homomorphic

$$\text{FinalCheck}(x, T_{LPCP}, r_1, \dots, r_t)$$

quadratic function

Publicly Verifiable

Bilinear Pairings

Asymmetric pairing

Cyclic groups G_1, G_2, G_T with generators g_1, g_2, g_T respectively.

$$e: G_1 \times G_2 \longrightarrow G_T$$

$$e(g_1^a, g_2^b) = g_T^{ab}$$

Symmetric pairing:

$$e: G \times G \longrightarrow G_T$$

$$e(g^a, g^b) = g_T^{ab}$$

Secure Multi-Party Computation

Alice

x

Second date?

$$f(x, y) = x \wedge y$$

Bob

y

Who is richer?

$$f(x, y) = \begin{cases} 0 & \text{if } x > y \\ 1 & \text{otherwise} \end{cases}$$

Common friends?

$$f(x, y) = x \wedge y$$

Secure Two-Party Computation (2PC)

Alice

x

Bob

y

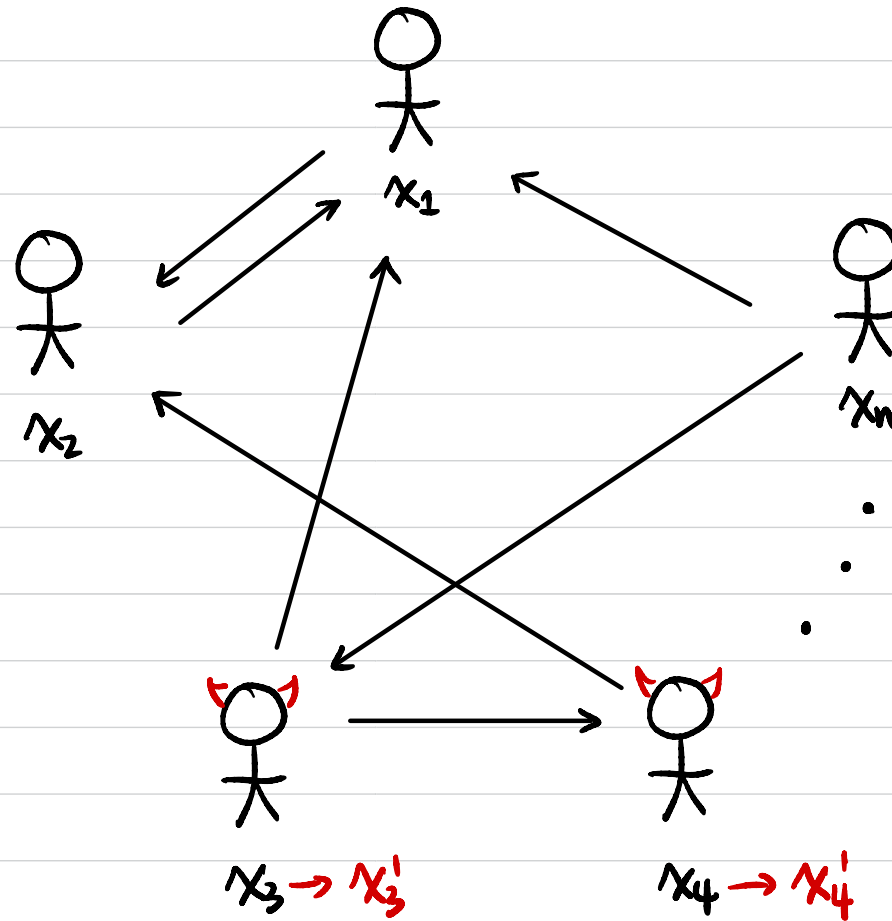

$$z = f(x, y)$$

Applications:

- Password Breach Alert (Chrome / Firefox / Azure / iOS Keychain)
- Privacy-Preserving Contact Tracing for COVID-19 (Apple & Google)
- Ads Conversion Measurements / Personalized Advertising (Google / Meta)

Secure Multi-Party Computation (MPC)

$$z = f(x_1, \dots, x_n)$$

Secure Multi-Party Computation (MPC)

Applications:

- Privacy-Preserving Inventory Matching (J.P. Morgan)
- Setup Ceremony to securely generate CRS (Zcash)
- Distributed Key Management (Unbound / Coinbase)
- Federated Learning (Google Keyboard Search Suggestion)
- Auctions (Danish sugar beet auction)
- Boston gender wage gap (Boston Women's Workforce Council)
- Study / Analysis on Medical Data
- Fraud Detection (banks)

Setting

- n parties P_1, P_2, \dots, P_n
with private inputs x_1, x_2, \dots, x_n
- Jointly compute $f(x_1, x_2, \dots, x_n)$
- Communication:
Authenticated secure point-to-point channels between each pair (P_i, P_j)
(Sometimes also assume broadcast channel)
- The adversary can "corrupt" a subset of the parties
(e.g. at most t parties)

What properties do we want?

General Security Properties

- **Correctness:** The function is computed correctly.
- **Privacy:** Only the output is revealed.
- **Independence of Inputs:** Parties cannot choose inputs depending on others' inputs.
- **Security with Abort:** Adversary may "abort" the protocol.
(preventing honest parties from receiving the output)
- **Fairness:** If one party receives output, then all receive output.
- **Guaranteed Output Delivery (GOD):** Honest parties always receive output.

Adversary's Power

Allowed adversarial behavior:

- Semi-honest / passive / honest-but-curious:
Follow the protocol description honestly,
but try to extract more information by inspecting transcript.
- Malicious / active:
Can deviate arbitrarily from the protocol description.

Adversary's Computing Power:

- Unbounded computing power \Rightarrow Information-Theoretic (IT) Security
- PPT bounded \Rightarrow Computational Security
