

CSCI 1515 Applied Cryptography

This Lecture:

- CBC-MAC
- Password-Based Authentication
- Two-Factor Authentication (2FA)
- Putting it All Together: Secure Authentication

Summary

	Symmetric-Key	Public-Key
Message Secrecy	Primitive: SKE Construction: block cipher	Primitive: PKE Constructions: RSA / ElGamal
Message Integrity	Primitive: MAC Constructions: CBC-MAC / HMAC	Primitive: Signature Constructions: RSA / DSA
Secrecy & Integrity	Primitive: AE Construction: Encrypt-then-MAC	
Key Exchange		Construction: Diffie-Hellman
Important Tool	Primitive: Hash function Construction: SHA	

Block Cipher

$F: \{0, 1\}^\lambda \times \{0, 1\}^\lambda \rightarrow \{0, 1\}^\lambda$ ^{← 128} pseudorandom permutation (PRP).

$$k \leftarrow \{0, 1\}^\lambda$$

$F_k:$

$\mathcal{F}$

$$f \leftarrow \{ F \mid F: \{0, 1\}^\lambda \rightarrow \{0, 1\}^\lambda, \\ F \text{ is bijective} \}$$

$f:$

CBC-MAC

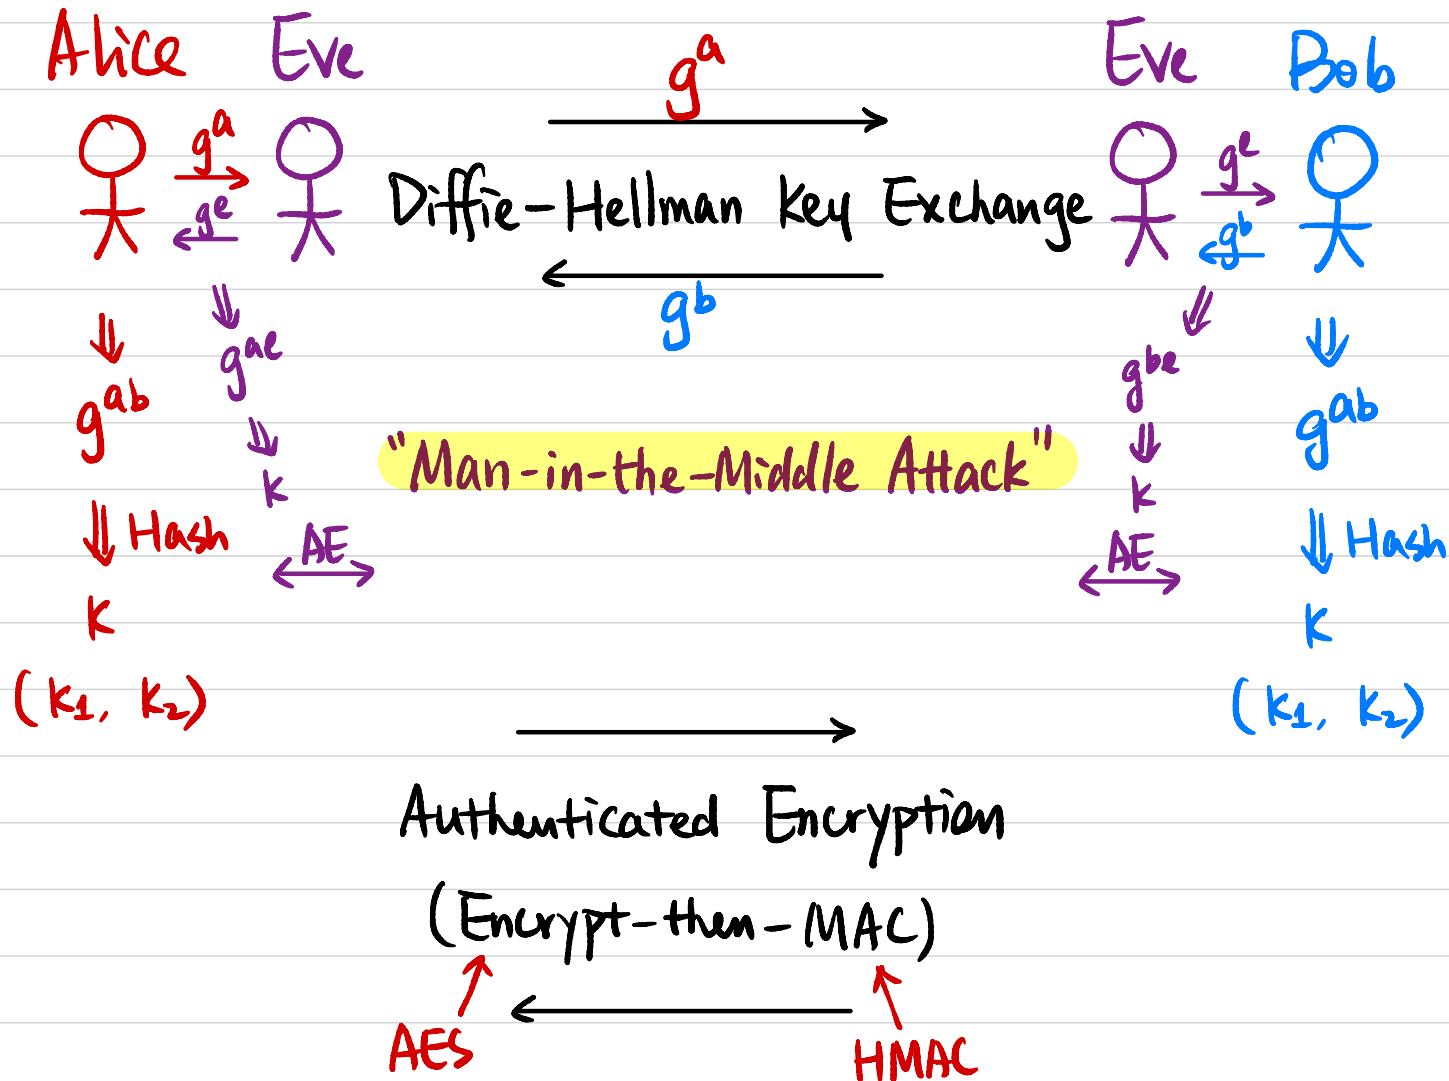

How to verify? $Vrfy_k(m, t)$

CMA (Chosen Message Attack) Secure?

- Fixed-length messages of length $3 \cdot \lambda$
- Arbitrary-length messages

Putting it All Together: Secure Communication

Any security issue?

Authenticated Key Exchange

Signature Scheme

public
↓
 $(VK_A, SK_A) \leftarrow \text{Gen}(1^\lambda)$

Alice

↓
 g^a

↓ Hash

K

(K_1, K_2)

public
↓
 $(VK_B, SK_B) \leftarrow \text{Gen}(1^\lambda)$

Bob

↓
 g^b

↓ Hash

K

(K_1, K_2)

$\xrightarrow{g^a}$
Diffie-Hellman Key Exchange
 $\xleftarrow{g^b}$

Authenticated Encryption

(Encrypt-then-MAC)

One-Sided Secure Authentication

public
↓
 $(VK_B, SK_B) \leftarrow \text{Gen}(1^\lambda)$

Password-Based Authentication

Password Security ?

Online Dictionary Attack

User

Server

ID, password

$h = H(\text{password})$

Signup

$\xrightarrow{\text{ID, } h}$
(Encrypted)

Store (ID, h) (Encrypted)

Login

$\xrightarrow{\text{ID, } h' = H(\text{pwd}')}$
(Encrypted)

Offline Dictionary Attack

User

ID, password

$h = H(\text{password})$

Signup

$\xrightarrow{\text{ID, h}}$
(Encrypted)

Server

Store (ID, h) (Encrypted)

$h' = H(\text{pwd}')$

(preprocessing)

Salting

Why does it help?

Salt & Pepper

Why does it help?

Slow Hash Functions

- Computation-heavy hash function
 - ↳ compose SHA256 in a certain way.

Application-Specific Integrated Circuit (ASIC) → blockchain mining

- Memory-hard hash functions
 - ↳ Scrypt

Two-Factor Authentication (2FA)

How would you design it?

Putting it All Together: Secure Authentication

One-Sided Secure Authentication

Two-Sided Authenticated Key Exchange

$(VK_A, SK_A); \text{cert}_A \leftarrow \text{Sign}_{SK_A}(\text{Alice}, VK_A)$

$(VK_B, SK_B); \text{cert}_B \leftarrow \text{Sign}_{SK_B}(\text{Bob}, VK_B)$

→
Authenticated Encryption
(Encrypt-then-MAC)
←
