

# 14: Embedded SW Engineering

# Switching to SW engineering

## Where we've been

Low-level details of embedded (IO, architecture, clocks, some OS/scheduling)

## Where we're going

Bigger picture: software engineering for embedded

*What is the difference  
between software  
engineering and  
programming?*

## People skills

Software engineering involves working with people, to make products that will be used by people

We are not flawless, nor are we machines

We have biases, bad days, grudges, weaknesses, but also empathy, collaboration, and diverse viewpoints

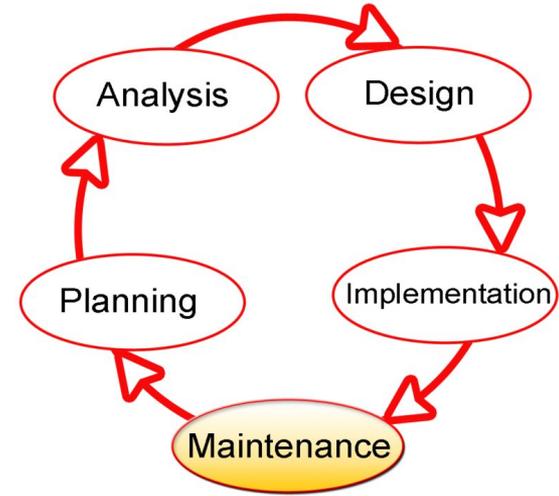

*What are some ways that sloppy communication or poor management can make for bad code?*

# System development life cycle

5-10+ stages, may include

- Idea or solicitation by customer
- Marketing
- Planning
- Requirements/analysis
- Design
- Implementation/development
- Testing
- Verification and validation
- Operation/maintenance

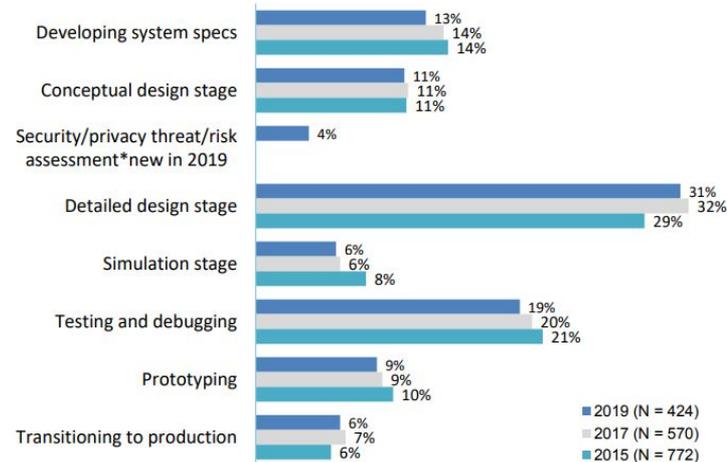

[Image source](#)

# Planning and design makes up majority of SW process

38

What percentage of your design time is spent on each of the following stages?

# Illustrative example: standing desk

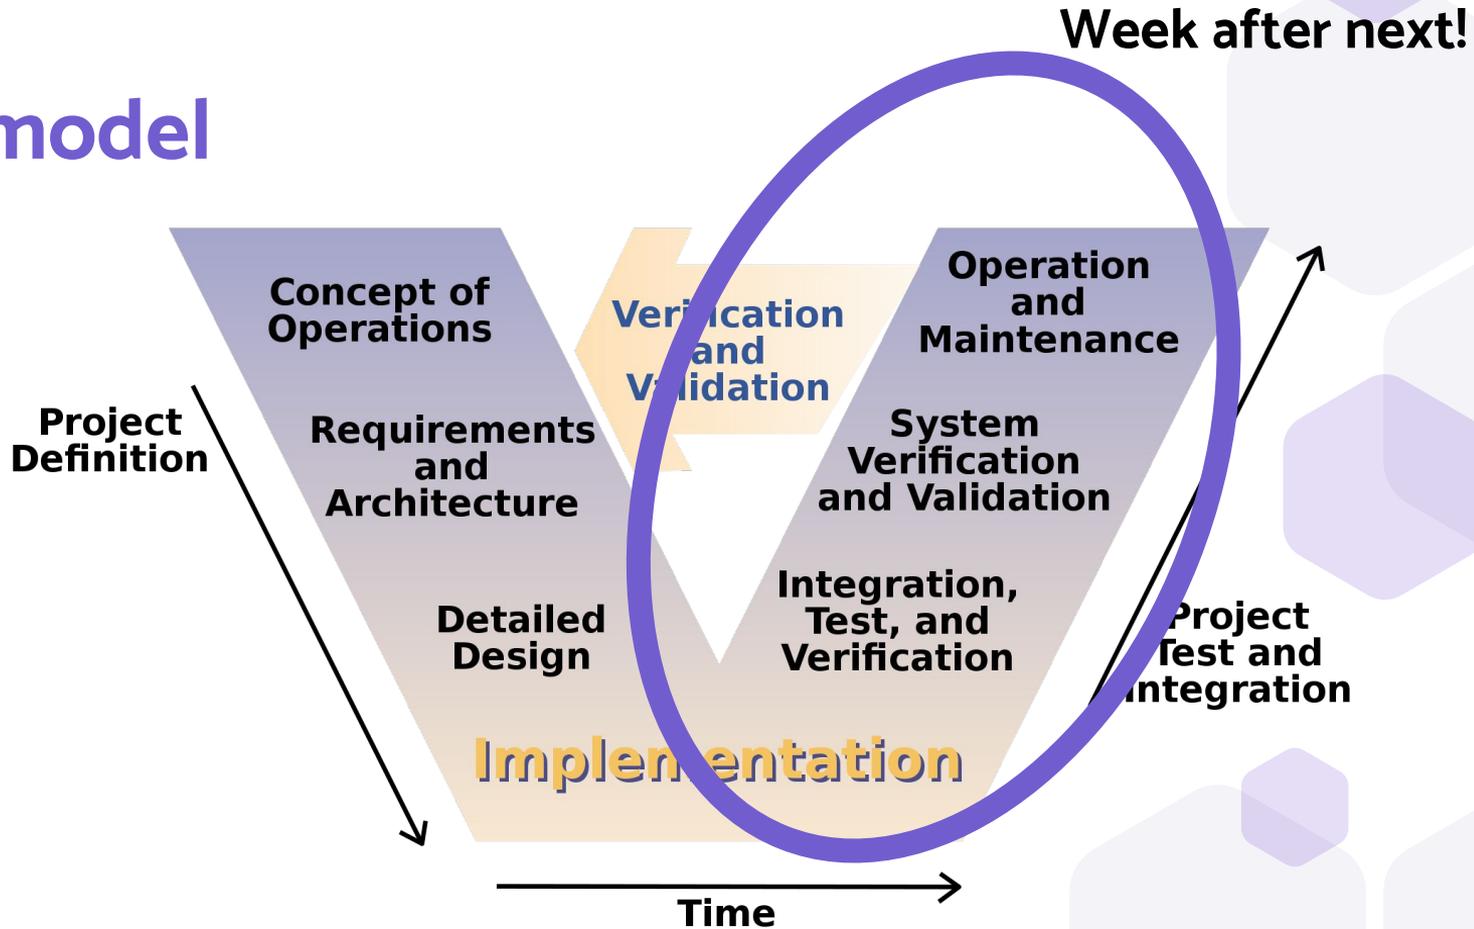

*What would it make more sense to do first:*

- 1. Write standing desk controller requirements*
- 2. Unit test standing desk controller*
- 3. Write standing desk user requirements*
- 4. System test standing desk*

# V model

# Left side of V model

**Product requirements**

What the product does from the customer POV

**Software requirements**

What the product does from the SW POV (high-level, not the “how”)

**High level/architecture design**

What modules there are in the system, which module performs which function, how modules communicate

**Low level/module design**

Flowcharts, statecharts/finite state machines, algorithms...

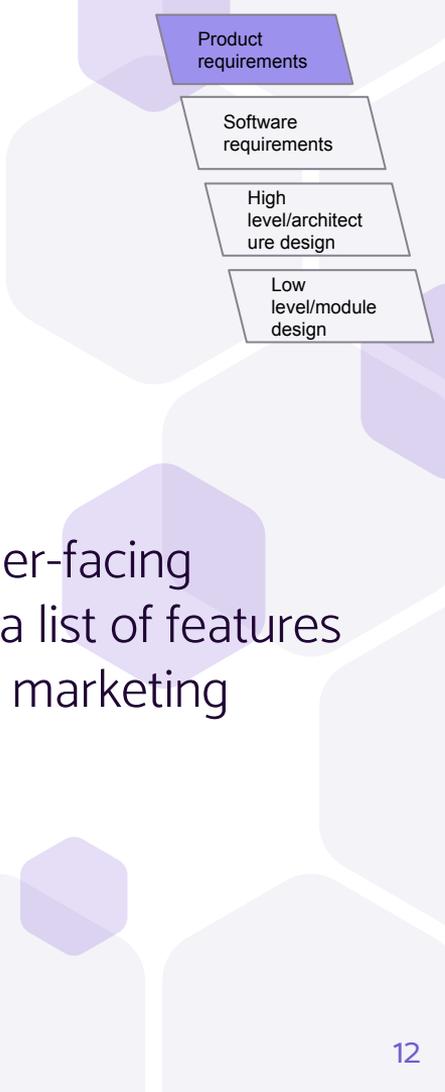

# Product requirements

Our electric height-adjustable table allows you to easily and effortlessly change from sitting to standing positions throughout your day. Raising and lowering the table is simple, using its ultra quiet, feature-rich electric mechanism. It's an essential tool to any modern workspace.

Details:

- Changing your posture often keeps you more engaged and more comfortable
- Meetings are significantly shorter when standing vs. sitting
- Height-adjustable tables are essential to modern workspaces and prized by office workers everywhere
- Push-button activation with height display readout
- 3 memory positions

Product requirements

The diagram shows a vertical hierarchy of requirements levels. It starts with 'Product requirements' at the top, followed by 'Software requirements', 'High level/architecture design', and 'Low level/module design' at the bottom. Each level is contained within a trapezoidal box that tapers downwards. The boxes are connected by a vertical line, and the entire structure is set against a background of overlapping light purple hexagons.

Software requirements

High level/architecture design

Low level/module design

Customer-facing  
Can be a list of features  
Used in marketing

# Software requirements

Written with specific wording and format

“Shall” - the software **must** do this

“Should” - the software has this goal

Labeled or numbered (RS-1, RS-2, RS-2.a...)

Precise and measurable

Quantitative over qualitative

Can be tested

*What* the software does, not *how*

Low level/module design

# Standing desk requirements

R1: If the desk is not at its maximum height, and the up button is held, the motor shall be commanded UP

R2: If the M button is pressed and released, and one of the numbered buttons [1, 2, 3] is pressed and released within 10 seconds, then the current height shall be stored as a preset for the corresponding numbered button

R3: If one of the numbered buttons [1, 2, 3] is held, the motor should be commanded such that the desk height moves to the corresponding preset height

*Come up with additional requirement(s) that refine the preset behavior*

**R3: If one of the numbered buttons [1, 2, 3] is held, the motor should be commanded such that the desk height moves to the corresponding preset height**

Low level/module design

Current height of desk

Motor command (up, down, or stopped)

Motor controller\*

Microcontroller

Height to display

LED Display

Button [1, 2, 3, M, Up, Down] pressed or held down

Button array

*\*Here we make the assumption that the motor controller is able to output the current height of the desk (for example, based on initial calibration and on how long the motor is commanded on). This may not actually be how the controller receives the height on the product, but it's an assumption of how there might be bidirectional communication between two components in a product architecture.*

Boxes-and-arrows for standing desk

# Sequence diagrams

Shows interaction between components

Columns: components

Arrows between columns: data sent across interfaces

Temporally arranged (lower is later)

Usually one for each customer **scenario**

Scenario is variant of a **use case**
