

My project's name was Music Hypertext done in CSCI 1951V with Andy Van Dam and Norm Meyrowitz. We built an Audio Hypertext System to help users find songs, playlists, or lyrics using hypertext-links to 'tags'. Tags describe 'states of mind' or 'environments' that users can use to search the audio hypertext corpus. This would allow users to search songs by mood as well as by title or artist. We also implemented lyric annotation, and the ability to make anchors in songs.
