Title

GitHubGo: A Distributed Search Engine for GitHub READMEs

Abstract

This paper presents the design, implementation, and evaluation of GitHubGo, a distributed and scalable GitHub README search engine developed for CS1380 at Brown University. GitHubGo implements GitHub README crawling and indexing workflows on a custom distributed MapReduce pipeline. It supports arbitrary-length search strings and uses TF-IDF scores to index search terms. The distributed system runs on 16 Amazon Web Services EC2 servers. GitHubGo achieves a throughput of 1247 queries per second doing a distributed search over 300k GitHub READMEs.
